

PC-12-GFP-luc

CSI464Ra11

Instruction manual

FOR RESEARCH USE ONLY
NOT FOR USE IN CLINICAL DIAGNOSTIC PROCEDURES

1st Edition (Revised in Jul, 2024)

[DESCRIPTION]

PC-12 is a cell line that was derived from a transplantable rat pheochromocytoma. High differentiation cells have multiple protrusions with different numbers of protrusions and longer synapses, similar to neuronal axons. PC-12-GFP-luc cells carry GFP and luciferase genes through lentiviral transfection, and can stably express firefly luciferase and green fluorescent protein. The cell line was stable and could be cultured for 30 generations without adding antibiotics. It can be used as a positive control in the detection of firefly luciferase activity, and can also be used in live animal imaging experiments.

Synonyms: PC-12-GFP-luc; PC12-GFP-luc; PC-12/GFP/luc; PC12/GFP/luc

I. Introduction

Host Cell: PC-12

Plasmid vector: pLVX-Luc2-P2A-AcGFP1-puro

Target Gene / Reporter(s): Green Fluorescent Protein; Firefly Luciferase

Resistance gene: Puromycin

Stability: 30 passages(in-house test, that not means the cell line will be instable beyond the passages we tested.)

II. Description of Host Cell Line

Organism: Rattus norvegicus, rat

Tissue Source: Adrenal gland

Disease: Pheochromocytoma

Gender: Male

Morphology: Polygonal

Growth Properties: Adherent

[PROPERTIES]

Cell activity: >85% (Viability by Trypan Blue Exclusion).

Formulation: Frozen 1 mL or T25 flask.

Biosafety: Negative for HIV-1, HBV, HCV, mycoplasma, bacteria, yeast and fungi.

Applications: For research use only. It is not approved for human or animal use, or for application in clinical diagnostic procedures.

Size: >5×10⁵cell/vial

[STORAGE]

Upon receiving, check all containers for leakage or breakage. directly and immediately transfer the cells from dry ice to liquid nitrogen and keep the cells in liquid nitrogen until they are needed for experiments.

Form & Buffer: Supplied as solution form in frozen stock solution, containing 90%FBS+10%DMSO.

Storage conditions: liquid nitrogen

[USAGE]

Culture conditions:

Complete growth medium: RPMI-1640+10%FBS+1%P/S Solution+10ug/ml Puromycin

Temperature: 37°C

Condition: 95% air, 5% carbon dioxide

Resistance screening:

1. The cell was stably transfected with GFP+luc, and its fluorescence intensity gradually decreased with the increase of cell passage times. If the fluorescence intensity needs to be maintained, puromycin can be added for re-screening. The screening concentration of purinomycin was 10µg/ml.
2. It is recommended to pass the cells for at least 3 generations after receiving them, and then screen them after freezing and retaining the species.
3. For initial cell screening, it is recommended to add complete medium with a final concentration of 1µg/ml puromycin for maintenance culture of 2-3 days. The concentration of puromycin was gradually increased to a maximum drug concentration of 10µg/ml, and the culture was maintained.

Cell recovery:

1. Thaw the vial by gentle agitation in a 37°C water bath. To reduce the possibility of contamination, keep the cap out of the water. The thawing time is about 2 minutes.
2. Remove the vial from the water bath as soon as the contents are thawed, and decontaminate by spraying with 75% ethanol. All of the operations from this point on should be carried out under strict aseptic conditions.
3. Transfer the vial contents to a centrifuge tube containing 9.0mL complete culture medium. and spin at approximately 1000 rpm for 5 minutes.
4. Resuspend cell pellet with the recommended complete medium . and dispense into a T25 culture flask.
5. Incubate the culture at 37°C, 5% CO₂ in a suitable incubator.

Cell passage:

1. Cell passage when cell growth at 85-95%.
2. Remove and discard culture medium and wash with PBS 1-2 times.
3. Add 1.0 mL of Trypsin-EDTA solution to flask and observe cells under an inverted microscope until cell layer is dispersed (usually within 2 to 3 minutes. Cells that are difficult to detach may be placed at 37°C to facilitate dispersal). Stop digestion by adding 2-3 ml of complete medium containing 10% serum. Make it a single cell suspension.

4. Add the fresh medium to resuspend the cells. Unless otherwise stated, the recommended ratio of primary cells is 1/3-1/4.

[Shipping]

Dry ice.

[IMPORTANTNOTE]

1. This product is intended for laboratory research use only. It is not intended for any animal or human therapeutic use, any human or animal consumption, or any diagnostic use.
2. To insure the highest level of viability, thaw the vial and initiate the culture as soon as possible upon receipt. If upon arrival, continued storage of the frozen culture is necessary, it should be stored in liquid nitrogen vapor phase and not at -70°C. Storage at -70°C will result in loss of viability.
3. After cell recovery, please take regular microscopic examination and photos to record the growth status of cells.
4. Read the instructions carefully, and keep and operate in strict accordance with the instructions. If you observe abnormalities or have questions about cell culture operations, please contact us in time.

[Figure]

1. PC-12-GFP-luc cells screened by puromycin could still stably express GFP at a high level after 30 generations of continuous culture in complete medium without puromycin, and there was no significant difference in cell morphology between PC-12-GFP-luc cells and untransfected cells.

Figure 1

Figure 1 Morphology of PC-12-GFP-luc (Optical microscope,200x)

Figure 2

Figure 2 Morphology of PC-12-GFP-luc (Fluorescence microscope,200x)

2. Assay of luciferase activity in vitro

PC-12 and PC-12-GFP-luc cells were taken, supernatant medium was removed, and 2ml of D-Luciferin working solution was added into the cells respectively. The luminescence was detected and image analysis was performed. The results showed that PC-12-GFP-luc cells could stably and highly express luciferase.

- A: PC-12-GFP-luc+D-Luciferin, Sodium Salt
- B: PC-12-GFP-luc+PBS
- C: PC-12+D-Luciferin, Sodium Salt
